

Appendix C-The Supplementary Statement on the

Algorithm Parameters

Since the Level-1 parameter set does not provide an 80-bit quantum security level, we have decided to use the following parameter sets for the corresponding security levels in the performance evaluation:

- The Level-2 parameter set is used to evaluate performance at the 128-bit classic security and 80-bit quantum security level.
- The Level-3 parameter set is used to evaluate performance at the 256-bit classic security and 128-bit quantum security level.
- The Level-4 parameter set is used to evaluate performance at the 512-bit classic security and 256-bit quantum security level.

Accordingly, the Level-1 parameter set will no longer be used in this algorithm.
